## **GlyDerm® Intense C Serum with QuSome® Delivery Technology Offers Added Protection from the Sun's Damaging Rays**

### *QuSomes® Stabilize L-Ascorbic Acid Delivering Potent Antioxidant Benefits to the Skin*

SUMMIT, NJ, April 2, 2014 – It's been a long, hard winter for much of our country and people are eager to get outside and enjoy the sunshine. But, while the sun's rays might elevate our mood, its ultraviolet rays can wreak havoc on our skin. Exposure to UV rays causes skin damage and aging and most alarming, can lead to skin cancer. GlyDerm's Intense C Serum with QuSome® delivery technology is formulated to help protect skin from the sun's ultra violet rays and to reduce the signs of aging associated with photo-damaged skin.

There's no replacement for a good broad-spectrum sunscreen to protect the skin from cancer and early aging but there's lots of medical evidence to suggest that adding Vitamin C to your daily skin care regimen can enhance sun protection and even reverse the signs of aging.

UV rays generate free radicals which are reactive molecules that age skin and damage DNA. Vitamin C is a potent antioxidant that enhances the body's ability to defend itself from free radicals. L-ascorbic acid is the form of Vitamin C that works best for skin, but it is highly unstable and oxidizes quickly after being applied, rendering it ineffective.

GlyDerm's innovative Intense C Serum uses QuSome® technology to encapsulate the L-ascorbic acid. This unique form of encapsulation stabilizes the L-ascorbic acid allowing it to penetrate the skin to help neutralize free radicals and stimulate collagen synthesis to reduce the signs of aging.

So, enjoy the sunny, warm days ahead but play it safe. Wear a broad spectrum sunscreen, wear sun protective clothing, seek shade when the sun's rays are at their strongest and add GlyDerm Intense C Serum with QuSome® delivery technology to your daily skin care regimen.
